

IMPORTANT NOVELTIES

.....
This new system allows us to join two units together laterally as well as pushing from front to back to make the join easier.

NEW JOINING CLICK FOR THE ARIANNE

This new joining click system replaces the one we used before. The system is based on the traditional system of serrated join.

The design allows joining the unit laterally as well as pushing from front to back, which is most suitable places with very little lateral space. It makes the join much easier.

The new system has been designed under the new designing aims for a sustainable economy, trying to cut back the number of components and the raw material used as much as possible.

You only need to use 2 bolts for a set of Joining clips (the usual needed four bolts for a set)

In addition, this joining clip is compatible with the actual Arianne drills. Therefore, it is possible to

replace old Arianne joining clips and add the new joining clips instead.

If distributors request it, we will supply some set of joining clips, so that they can give them to customers who are interested.

You can find the instructions for the new joining click attached. Please find a tutorial video and virtual animations which explain how to assemble it and use it.

THEY ARE COMPATIBLE WITH THE ACTUAL ARIANNE DRILLS

THE USERS WITH OLD CONNECTORS CAN REPLACE THEM FOR THE NEW ONES
